

MEMORANDUM

To: Data Analytics Team

From: Managing Director

Date: 9th March 2026

Subject: Request for Data Analysis on Customer Support Operations

Dear Team,

Over the past few months, we have observed several challenges within our customer support operations that require immediate attention and data-driven insights.

Customer calls remain a critical touchpoint between our organization and our clients, and it is important that we continuously monitor the efficiency, responsiveness, and overall customer experience delivered by our support team. Recently, however, management has received indications that some operational inefficiencies may be affecting service delivery.

Some of the key concerns raised include:

- An increasing number of **unanswered customer calls**, which may be affecting customer trust and service accessibility.
- Concerns about **slow response times**, with some customers experiencing delays before their calls are attended to.
- A noticeable number of **unresolved customer issues**, particularly in certain service categories.
- **Inconsistent performance among support agents**, where some agents appear to handle calls more effectively than others.
- **Customer satisfaction ratings that vary significantly**, suggesting that the service experience may not be consistent across all interactions.
- Certain **support topics appearing more frequently**, which may indicate recurring issues or gaps in service delivery.

Given these concerns, I would like the Data Analytics Team to conduct a comprehensive analysis of the customer support call data provided.

Specifically, the analysis should focus on the following areas:

1. **Call Volume Analysis** – Identify trends in the number of calls received, answered, and unanswered over time.
2. **Agent Performance Evaluation** – Assess how individual agents perform in terms of call handling, resolution rate, response speed, and customer satisfaction.
3. **Call Resolution Analysis** – Determine the proportion of calls successfully resolved and identify areas with low resolution rates.
4. **Customer Issue Analysis** – Examine the most common call topics and identify which issues require the most time or effort to resolve.
5. **Customer Satisfaction Assessment** – Evaluate how service delivery metrics such as speed of answer and call duration influence customer satisfaction ratings.

6. **Operational Efficiency Review** – Identify potential bottlenecks in call handling and areas where operational improvements can be made.

In addition to the analysis, I would like the team to develop an **interactive dashboard that provides clear insights into these operational metrics**, enabling leadership to monitor performance and make informed decisions.

Most importantly, your final report should include **data-driven recommendations on how the company can improve response times, increase issue resolution rates, enhance agent performance, and improve overall customer satisfaction**.

Your insights will play a key role in helping us strengthen our customer service operations and maintain the high service standards expected by our clients.

I look forward to reviewing your findings and recommendations.

Kind regards,

Managing Director
